

Staff Appointment Overlap Hard-Stop

Prevent the same staff member from holding two **Busy** appointments at the same time, on every SmartCare path that writes **Appointments**. Portable SQL for any SmartCare customer database. Select the target database in SSMS before you run.

ON THIS PAGE

7. Check assumptions

Deploy the package

Goal: hard-stop is on, Screen 46 is wired when safe, and you have a kill-switch.

- 1 **Open SSMS** connected to the target SmartCare database (Train or Prod). Do not rely on a **USE** statement in the script.
- 2 **Run** `SC_StaffAppointmentOverlap_apply_COMMIT.sql` start to finish (F5).
- 3 **Confirm** the result grids: Deployed = Y, Trigger = `tr_Appointments_S0HS` enabled, KillSwitch Value = Yes, Screen46 validate = `ssp_ValidateGroupServiceOverlap` (or apply stopped because another validate was already wired).
- 4 **Tell help desk** the key name `StaffAppointmentOverlapHardStop` for fast Off.

PERMISSIONS

GRANT EXECUTE is to `public` only. No named logins. ModifiedBy uses `SUSER_SNAME()`.

Verify it works

Use a test staff calendar that starts empty.

1. Save a Busy appointment at 1:00PM–2:00PM.
2. Try a second Busy at the same time for the same staff. Expect a hard **STOP** message with **TRY** times. The second appointment must not remain.
3. Save Busy at 2:00PM–3:00PM (empty). Expect a normal save.

NOTE

SmartCare may show its own soft “Save anyway?” first. Ignore that for pass/fail. Grade only the hard `STOP: ... TRY ...` message after OK.

EXPECTED MESSAGE SHAPE

```
STOP: Last, First is booked
mm/dd/yyyy h:mmAM–h:mmPM
for {name} (N meetings).
TRY (60 min): mm/dd/yyyy ...
```

No GroupService ids in staff text. Error! banners may flatten newlines.

Understand how it works

Custom Pages for Staff Calendar and recurrence have no validation stored-procedure hooks. Group Service Detail (Screen 46) can call a validate proc, but that alone misses calendar and series creates. This package uses a shared helper plus an `Appointments` AFTER INSERT/UPDATE trigger so every Busy write is covered.

Staff Calendar / New Event

Writes Appointments → trigger

Recurrence / series

Batch insert → trigger (siblings excluded)

Group Service Detail

Screen 46 validate + trigger

All Busy paths call `ssp_StaffAppointmentOverlapCheck` · kill-switch key must be Yes

ON SAVE (BOTTOM OK)

After any soft warning, SmartCare writes Busy appointment rows. The trigger checks each Busy staff row in that batch, including Additional Staff.

MID-FORM INSERT

Stages Additional Staff on the form only. It does **not** run the overlap check. OK does.

Know what is blocked

SITUATION	HARD-STOP?
Same staff, overlapping Busy times	Yes
Partial overlap (for example 1:00–2:00 vs 1:30–2:30)	Yes
Different staff, same clock time	No
Show Time As Free / Tentative / Out Of Office	No
Prior meeting Cancelled / No Show / Rescheduled only	No (slot reusable)
Clean recurring series on empty hours	No (batch self-exclude)

Look up objects

OBJECT	NAME	ROLE
Procedure	ssp_StaffAppointmentOverlapCheck	Shared Busy check + Style B message
Procedure	ssp_ValidateGroupServiceOverlap	Screen 46 Detail validate wrapper
Trigger	tr_Appointments_SOHS	Hard-stop on Appointments INSERT/UPDATE
Config key	StaffAppointmentOverlapHardStop	Yes = on, No = off without DROP
Screen wire	ScreenId 46	ValidationStoredProcedureUpdate when empty or already ours

NAMING

Trigger abbrev **SOHS** = Staff Appointment Overlap Hard Stop (capitals S,A,O,H,S minus second-word A).

FILE	PURPOSE
SC_StaffAppointmentOverlap_apply_COMMIT.sql	Create helper, validate, trigger, key=Yes, wire Screen 46
SC_StaffAppointmentOverlap_unwire_screen46_COMMIT.sql	Clear Screen 46 validate only; leave trigger

Disable or undo

- 1 Fast Off:** set `StaffAppointmentOverlapHardStop` = **No**.
- 2 Full remove of hard-stop:** `DROP TRIGGER dbo.tr_Appointments_SOHS` (and set key No).
- 3 Detail only:** run the Screen 46 unwire script if Detail validate should go away but calendar protection should stay.

IMPORTANT

If Screen 46 already has a different `ValidationStoredProcedureUpdate`, apply will not overwrite it. The trigger still protects calendar and recurrence paths.

Check assumptions

- Standard Streamline SmartCare with `dbo.Appointments`, `GlobalCodes` categories `SHOWTIMEAS` and `PCAPPOINTMENTSTATUS`, `Screens`, `SystemConfigurationKeys`.
- Group Service Detail is ScreenId **46** on typical builds (confirm if your site customized screens).
- Deployer can `CREATE PROCEDURE / TRIGGER` and `UPDATE Screens` and `SystemConfigurationKeys`.
- Coexists with other `AFTER` triggers on `Appointments` via nest-level guard on this trigger.
